

House Price Prediction Project - Code Explanation Guide

This PDF starts a structured line-by-line explanation approach for the project.

1. `import numpy as np`

Imports NumPy and assigns the alias 'np'. Used for numerical computations and arrays.

2. `import pandas as pd`

Imports Pandas and assigns the alias 'pd'. Used for DataFrame operations and CSV handling.

3. `import matplotlib.pyplot as plt`

Imports Matplotlib plotting functions.

4. `import seaborn as sns`

Imports Seaborn for statistical visualizations.

Project Flow

EDA → Preprocessing → Baseline Model → Cross Validation → Hyperparameter Tuning → Final Evaluation → Prediction System

Note: The uploaded project contains hundreds of lines. A true line-by-line explanation would require a much larger document (50+ pages).

I can generate the complete detailed PDF section-by-section (Imports, EDA, Preprocessing, Modeling, GridSearchCV, Evaluation, Deployment) in subsequent steps.
